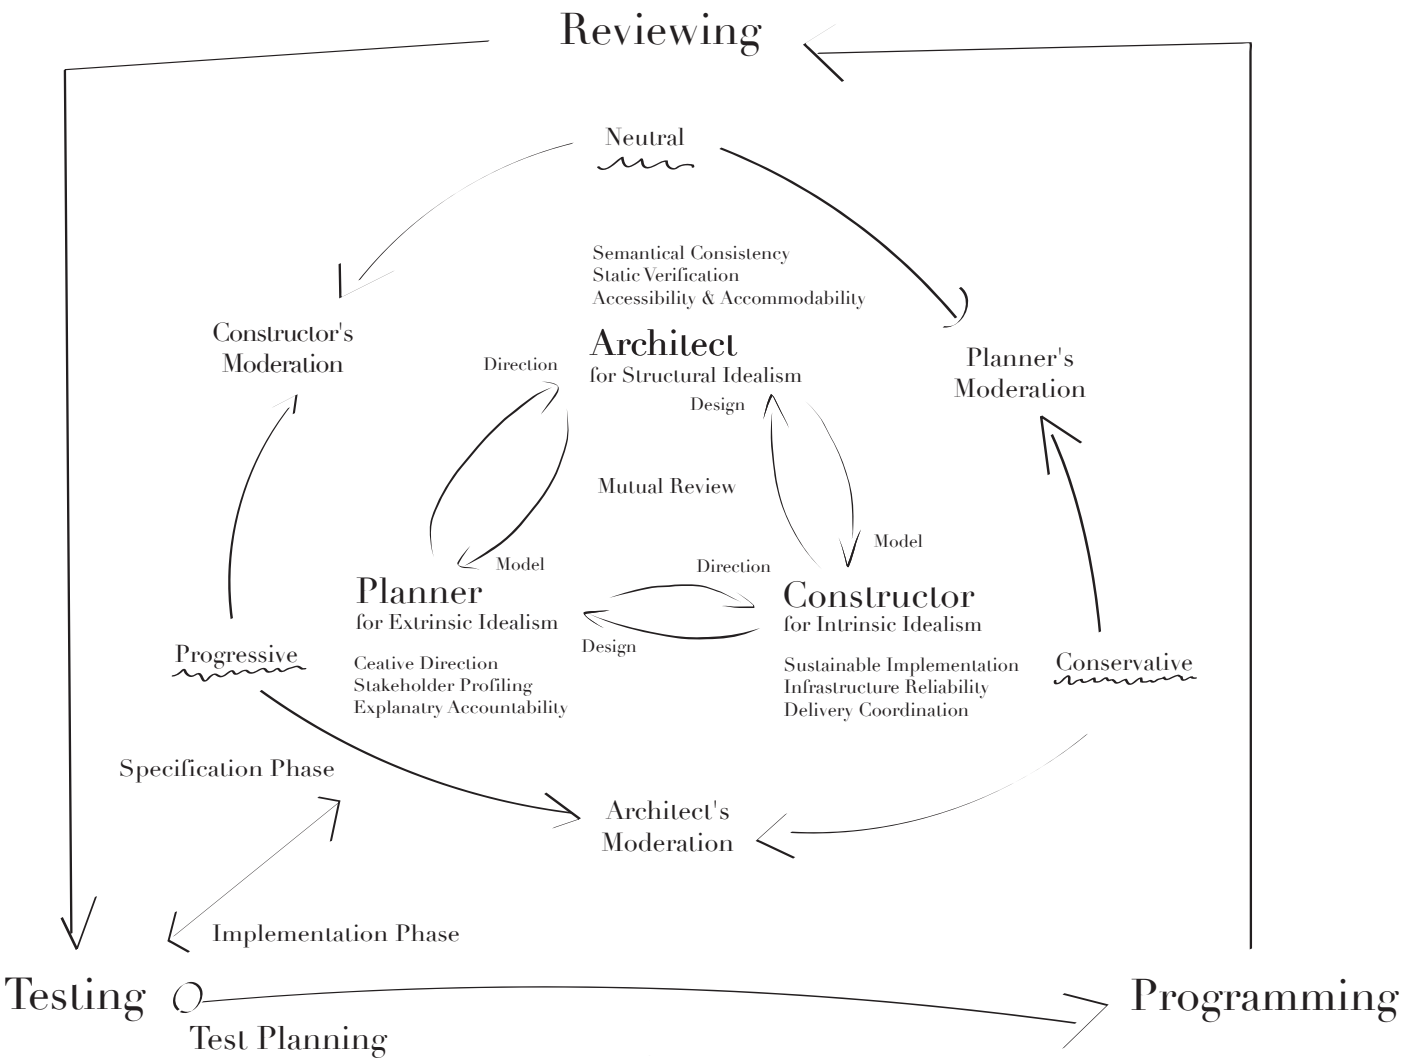
Implosive Structure for workaholic:trippin

Goal : Maximize benefit / Minimize loss (Optimization Problem)

Responsibility : Prevent what shouldn't happen (Constraint Satisfiction)



When a TripCommand is executed, a leader agent organizes the request and activates a three-member agent team: Planner, Architect, and Constructor. The Planner first produces a "Direction" artifact based on the initial instruction. This Direction is reviewed by the Architect and Constructor, and disagreements are resolved either through revision or mediated arbitration by the third party. Once agreed, the Architect derives a model, the Constructor determines the design, and all artifacts undergo mutual review until full consensus is reached within the inner loop.

After convergence on direction, model, and design, the process moves to implementation. The Planner creates a test plan aligned with the approved artifacts. The Constructor implements the program, the Architect reviews its structural integrity, and the Planner validates it through testing. This outer loop ensures that optimization goals and constraint responsibilities are both satisfied through structured collaboration and iterative refinement.

Ceative Direction
Stakeholder Profiling
(in Value Proposition)
Explanatry accountability

Semantical Consistency
Static Verification
Accessibility & Accommodability (Usecase Cutoff)

Sustainable Implementation
Infrastructure Reliability
(Obserbability, Security, Resilience)
Delivery Coordination
(Quality Assurance, Release Management)
